The script i made the singleton in is called "ThingyTracker"  
It is referenced in the "RankHandler" script

## **How to start / play game**

### **Title screen**

Top button goes to mode select, where the left button is to start from the beginning where the right button takes you to a not fully implemented level select

The next button goes to the character selector

The next is for achievements that do not exist yet

The next button is for quitting

### **Actual gameplay**

WASD to move

Left click/space for primary attack

Right click/shift for secondary attack

Upon leveling up use WASD to move around and Space to select or just mouse over them and click on them

### **What element of your game adopts the chosen pattern?**

I made a tracker that tracks what the player does, such as how long they are taking, how many enemies they killed out of all of the enemies in the level, and how damage they took. I made this so when the player beats a level they are given a ranking based off of how well they did. Higher rank for speed, amount of enemies killed, and less damage taken.

### **Why is this pattern a good choice for the associated functionality?**

Because this is needed in every level, and there is only a need for a single one to exist at a time.

Everything is made by me, except for the placeholder images in the upgrade menu, which i stole from google images and they will be replaced at some point probably.
